Introduction

- On molecular biology
- On genetic code
- On *p*-adic genetic code
- On bioinformation and similarity
- Concluding remarks

・ロ ・ ・ 四 ・ ・ 回 ・ ・ 日 ・

1. INTRODUCTION: ultrametric space

Ultrametric distance (F. Hausdorff, 1934) and space (M. Krasner, 1944):

(a)
$$d(x,y) \le \max\{d(x,z), d(z,y)\}$$

(b) $d(x,y) \le d(x,z) = d(z,y)$

1. INTRODUCTION: ultrametric space

- Applications?
 - In some very short-distance systems
 - p-adic strings
 - space-time geometry at the Planck scale
 - quantum systems
 - In some very complex systems
 - spin glasses
 - protein dynamics
 - In some information systems
 - genetic code
 - bioinformation
 - taxonomy
 - o phylogenetics
 - language
 - sequences of symbols

2. ON MOLECULAR BIOLOGY

DNA, RNA, nucleotides, codons, ...

Codons are ordered triples of four nucleotides (bases, letters): C = Cytosine, A = Adenine, T= Thymine (U =

Uracil) and G = Guanine. $4 \times 4 \times 4 = 64$ COdONS

3. ON GENETIC CODE

- The genetic code is a map from 64 codons onto 20 amino acids + 1 stop signal.
- There are 1.5×10^{84} mappings.
- Only 31 genetic code in living organisms.
- In human cells 3×10^9 base pairs in DNA. Only 1.5% of DNA codes proteins.
- In human cells there are two codes: standard and vertebrate mitochondrial code (VMC).
- VMC is simpler than standard code. All codes can be regarded as slight modifications of VMC.

3. ON GENETIC CODE: modeling of genetic code

- Why to model genetic code (GC)?
- What are problems in modeling GC?
- Many approaches to model GC:
 - Gamow (1954), Crick (1957), Rumer (1966), ...
 - Hornos and Hornos (1993); Frappat, Sciarrino and Sorba (1998); Forger and Sachse (2000); ...
- *p*-Adic (ultrametric) modeling:
 - Dragovich and Dragovich (2006)
 - Khrennikov and Kozyrev (2007)
 - Bradley (2007)
 - BD ...
 - BD, Khrennikov and Misic (2017)

• 5-adic distance between two different codons a and b

$$d_5(a,b) = |a_0 + a_15 + a_25^2 - (b_0 + b_15 + b_25^2)|_5$$

three possibilities:

$$a_0 \neq b_0 \Rightarrow d_5(a,b) = 1$$

 $a_0 = b_0, \ a_1 \neq b_1 \Rightarrow d_5(a,b) = rac{1}{5}$
 $a_0 = b_0, \ a_1 = b_1, \ a_2 \neq b_2 \Rightarrow d_5(a,b) = rac{1}{25}$

 With respect to the smallest (1/25) 5-adic distance, 64 codons clasterize into 16 quadruplets.

・ロト ・日下・ ・ ヨト

• 2-adic distance between 5-adic quadruplet codons

$$d_5(a,b) = |a_0 + a_15 + a_25^2 - (b_0 + b_15 + b_25^2)|_5$$

• Denote codons inside 5-adic quadruplets by *a*, *b*, *c*, *d*. Then 2-adic distance is:

$$d_2(a,c) = |(3-1)5^2|_2 = \frac{1}{2}$$
$$d_2(b,d) = |(4-2)5^2|_2 = \frac{1}{2}$$

Every quadruplet decays to two 2-adic doublets.

 Now 32 doublets make *p*-adic basic structure of codon space of 64 elements.

5. ON BIOINFORMATION AND SIMILARITY

- Bioinformation? Any sequence of nucleotides or amino acids
- Similarity? Similarity between two sequences.
- Why? Similar in structure similar in function!

・ 戸 ト ・ ヨ ト ・ ヨ ト

1

5. ON BIOINFORMATION AND SIMILARITY

- Let $a = a_1 a_2 \cdots a_n$ and $b = b_1 b_2 \cdots b_n$ be two strings of equal length.
- Hamming distance between these two strings is $d_H(a,b) = \sum_{i=1}^n d(a_i,b_i)$, where $d(a_i,b_i) = 0$ if $a_i = b_i$, and $d(a_i,b_i) = 1$ if $a_i \neq b_i$.
- We introduce *p*-adically modified Hamming distance in the following way: $d_{pH}(a, b) = \sum_{i=1}^{n} d_p(a_i, b_i)$, where $d_p(a_i, b_i) = |a_i b_i|_p$ is *p*-adic distance between numbers a_i and b_i . When $a_i, b_i \in \mathbb{N}$ then $d_p(a_i, b_i) \le 1$. If also $a_i b_i \ne 0$ is divisible by *p* then $d_p(a_i, b_i) < 1$.
- In the case of strings as parts of DNA, RNA and proteins, this modified distance is finer and should be more appropriate than Hamming distance itself. For example, elements a_i and b_i can be nucleotides, codons and amino acids with above assigned natural numbers, and primes p = 2 and p = 5.

6. CONCLUDING REMARKS

- The Genetic Code has *p*-adic ultrametric structure and is very simple and evident application of the *p*-adic distance.
- It describes degeneracy of the codon space.
- One can also introduce *p*-adic ultrametric structure of 20 amino acids.
- Genetic code is an ultrametric network. Network of codons

 small, intermediate and large community.
- Ultrametric (*p*-adic) approach to evolution of the genetic code is also considered.
- Ultrametric (*p*-adic) similarity is important for study bioinformation.
